**Analysis of the aphthovirus 2A/2B polyprotein
'cleavage' mechanism indicates not a proteolytic
reaction, but a novel translational effect: a putative
ribosomal 'skip'.**

Donnelly ML, Luke G, Mehrotra A, Li X, Hughes LE, Gani D, Ryan MD.

J Gen Virol. 2001 May;82(Pt 5):1013-25.

The 'cleavage' activities of foot-and-mouth disease virus 2A site-directed mutants and naturally occurring '2A-like' sequences.

Donnelly ML, Hughes LE, Luke G, Mendoza H, ten Dam E, Gani D, Ryan MD.

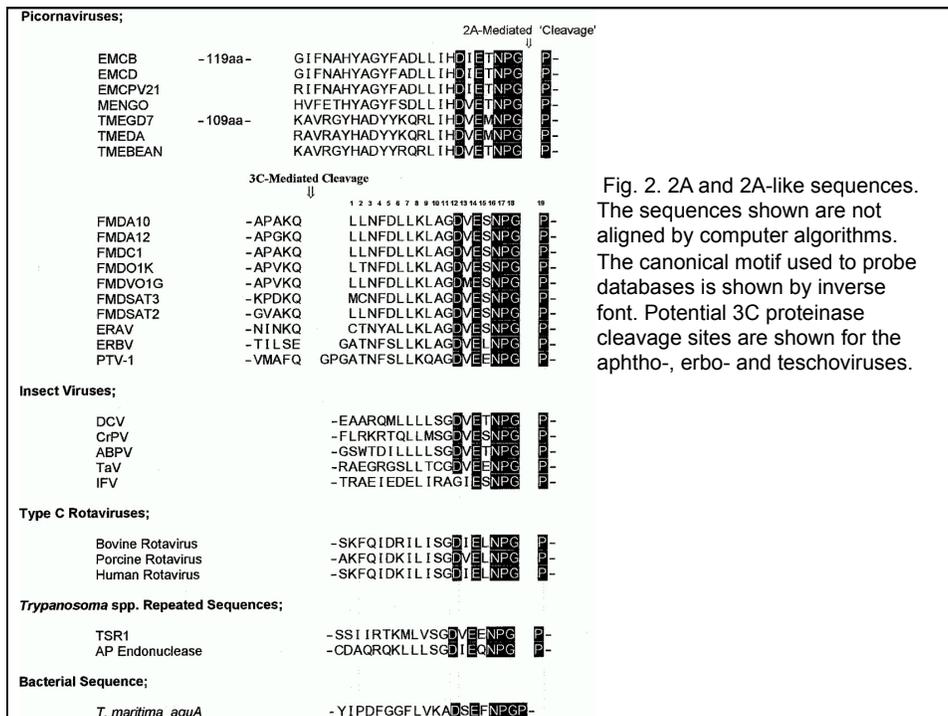

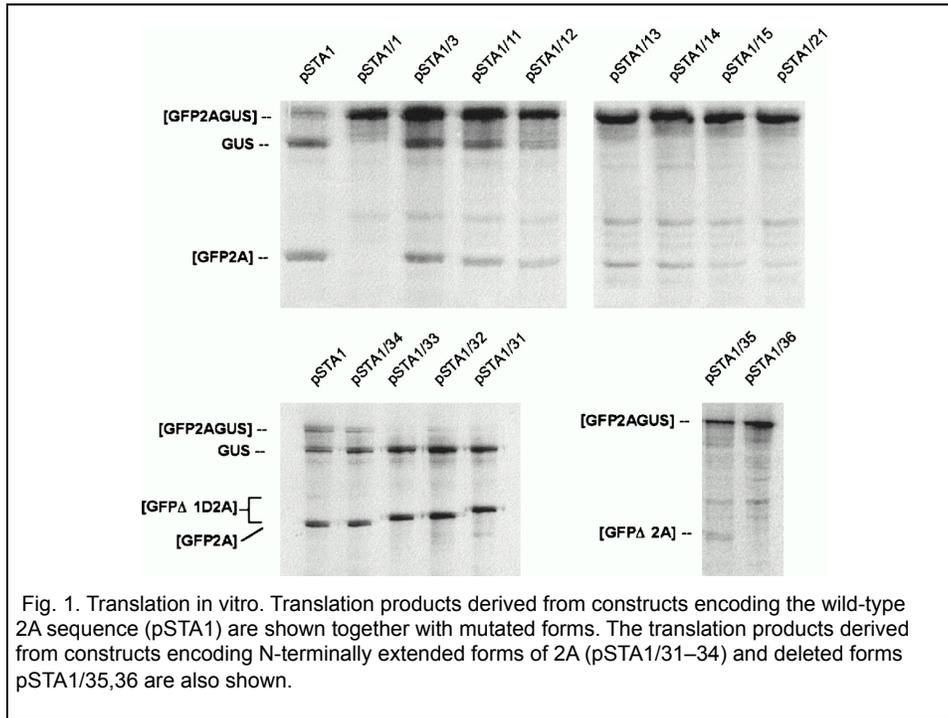

J Gen Virol. 2001 May;82(Pt 5):1027-41.

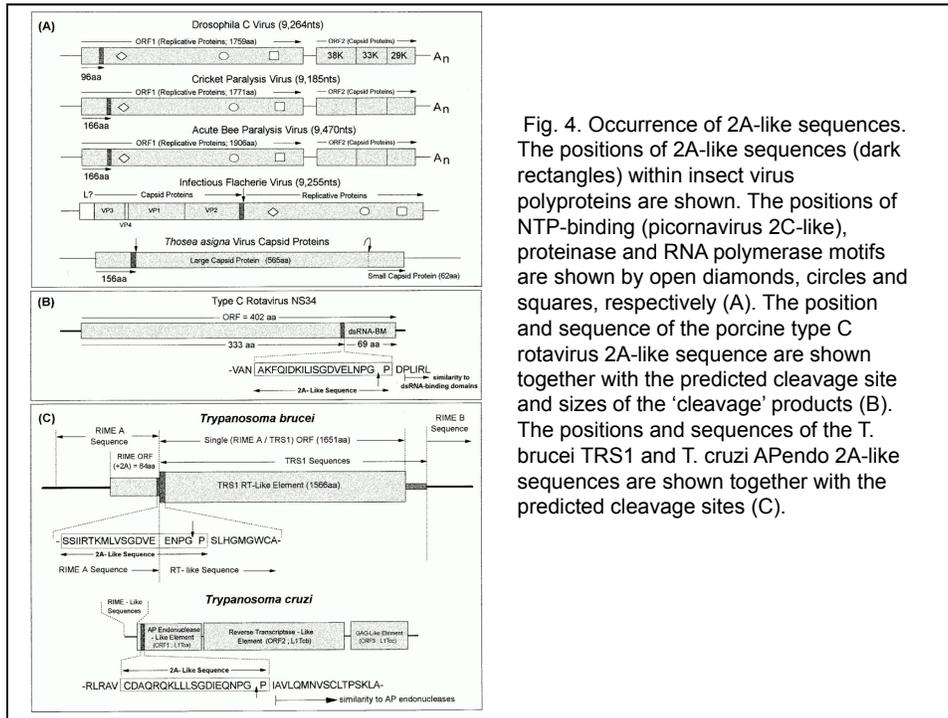

Fig. 4. Occurrence of 2A-like sequences. The positions of 2A-like sequences (dark rectangles) within insect virus polyproteins are shown. The positions of NTP-binding (picornavirus 2C-like), proteinase and RNA polymerase motifs are shown by open diamonds, circles and squares, respectively (A). The position and sequence of the porcine type C rotavirus 2A-like sequence are shown together with the predicted cleavage site and sizes of the 'cleavage' products (B). The positions and sequences of the *T. brucei* TRS1 and *T. cruzi* APendo 2A-like sequences are shown together with the predicted cleavage sites (C).

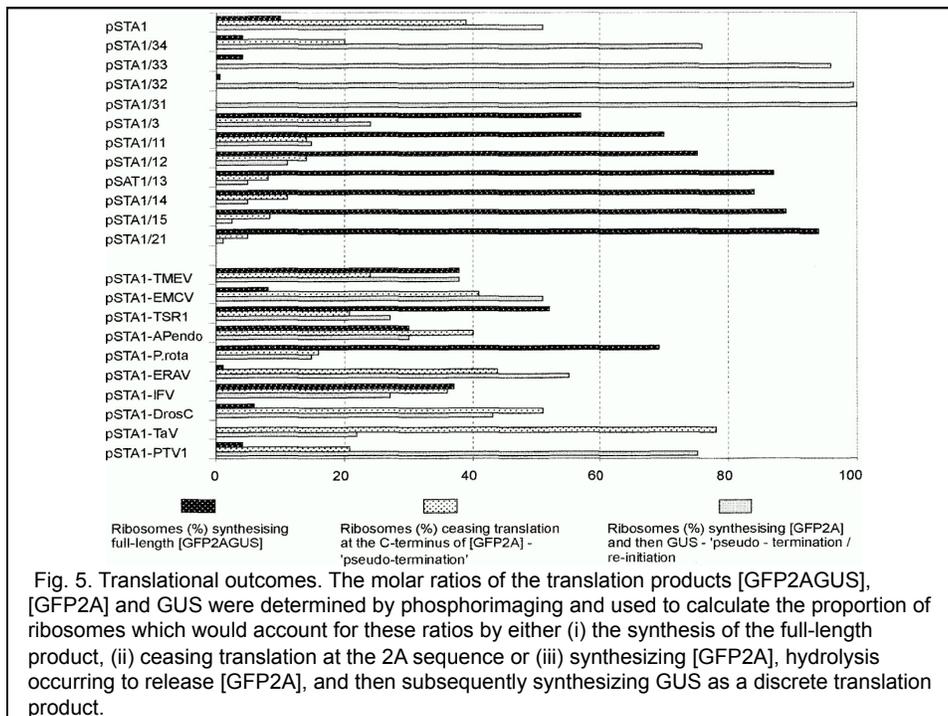

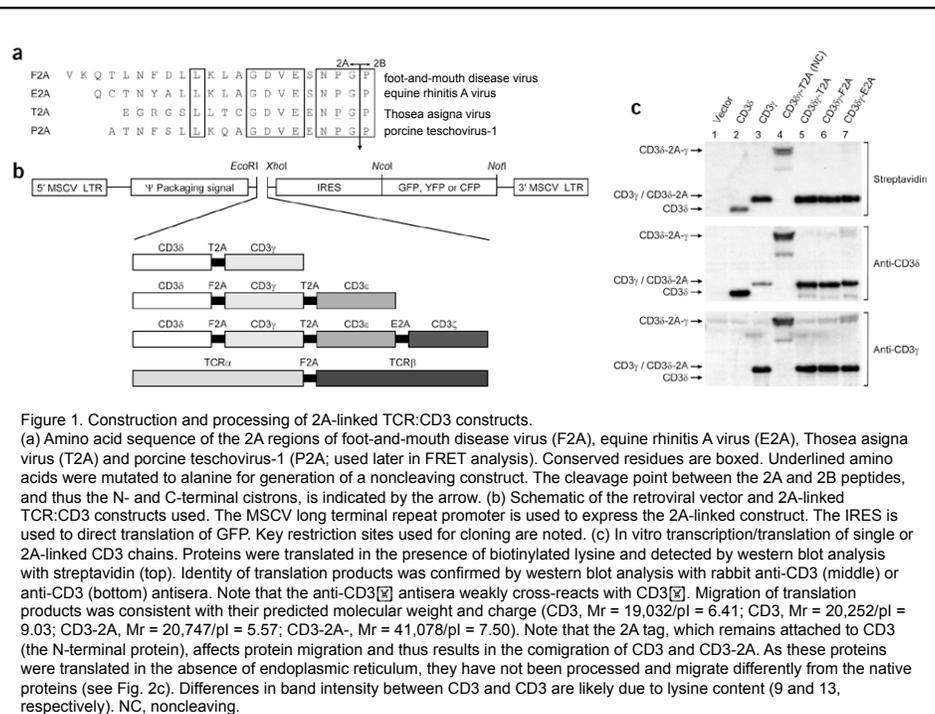

Fig. 5. Translational outcomes. The molar ratios of the translation products [GFP2AGUS], [GFP2A] and GUS were determined by phosphorimaging and used to calculate the proportion of ribosomes which would account for these ratios by either (i) the synthesis of the full-length product, (ii) ceasing translation at the 2A sequence or (iii) synthesizing [GFP2A], hydrolysis occurring to release [GFP2A], and then subsequently synthesizing GUS as a discrete translation product.

Correction of multi-gene deficiency in vivo using a single 'self-cleaving' 2A peptide-based retroviral vector.
